

ArchScale Hackathon · Official Problem Statement Brief

Build the marketing machine

Give a 10-person studio the automation of a 100-person company.

BACKGROUND

Architecture studios, interior designers and allied businesses depend heavily on lead generation, digital marketing, social media and follow-up.

However, many small and medium businesses still manually manage lead extraction and verification over email and WhatsApp, drip conversations, follow-ups and engagement, campaign responses, lead qualification, customer routing and marketing measurement.

Meta platforms provide APIs and advertising infrastructure that can enable automated marketing workflows.

PROBLEM

A potential customer may interact with a business through:

- Instagram / Facebook Ad → Conversation → Lead → Follow-up → Conversion
- WhatsApp → Conversation → Lead → Follow-up → Conversion
- Email Marketing → Conversation → Lead → Follow-up → Conversion

Without automation, businesses may lose leads because responses and follow-ups are delayed or inconsistent.

EXPECTED SOLUTION

Participants should develop an intelligent Marketing Workflow Automation System using Meta ecosystem capabilities where appropriate.

Lead Capture Capture leads from marketing campaigns or digital channels.	Lead Qualification Determine whether a lead meets predefined criteria.
Email & WhatsApp Automation Workflows Automate relevant conversations or follow-ups.	Lead Routing Send qualified leads to the appropriate person / team.
Follow-up & Engagement Automation Trigger follow-ups based on lead status.	Campaign Tracking Track campaign-to-lead performance.
CRM Integration Maintain lead / customer information.	Analytics Show basic marketing funnel performance.

KEY REQUIREMENTS

- Lead capture
- Lead information storage
- Lead qualification
- At least one automated workflow
- WhatsApp or Meta integration / mock integration
- Follow-up mechanism
- Basic campaign / lead analytics

Actual API integration may be demonstrated where feasible; a functional simulated integration may be acceptable for prototyping.
